Maurer-Cartan form. We give two examples of the geometry of curves in homogeneous spaces: classifying holomorphic mappings of the complex plane under fractional linear transformations in §1.7, and classifying curves in E^3 under Euclidean motions (i.e., rotations and translations) in §1.8. We also include exercises on plane curves in other geometries.

In the mathematical field of differential geometry, a Cartan connection is a flexible generalization of the notion of an affine connection. It may also be regarded as a specialization of the general concept of a principal connection, in which the geometry of the principal bundle is tied to the geometry of the base manifold using a solder form.

geometry and partial differential equations. These ideas originated about a century ago in the works of several mathematicians, including Gaston Darboux, Edouard Goursat and, most importantly, Elie Cartan. Over the years these techniques have been refined and extended; major contributors to the subject are mentioned below, under "Further Reading".

Elie Cartan pioneered the method of moving frames as a coordinate free way of studying differential geometry. A moving frame is a basis of vectors (tangent, movement, directional etc.) at each point of a curve, surface, or manifold. If the manifold is Riemannian (has a Riemannian metric), one considers orthonormal bases.
