Zio (Polytechnic of Milan, Italy) explains a number of methods for computing the reliability and risk characteristics of complex technological systems. They are Markov reliability and availability analysis, Monte Carlo simulations, Markov Chain Monte Carlo analysis, the basics of genetic algorithms, dependent failures, importance measures, and basic concepts of uncertainty and sensitivity analysis.

Computational methods for reliability and risk analysis ...
Monte Carlo simulation is the preferred method for reliability assessment of large and complex systems due to the realism it introduces, therefore, it is adopted as the benchmark when comparing accuracies among different computational methods. Both assessment methods have merit and demerit and can be very powerful when properly applied.
