

The proposed design is simulated in MATLAB software. A Hybrid Median Filter for Noise Removal in Digital Images: The main aim of this project is to remove impulse noises that cause corruption of images during storing and processing of captured images. So this project makes use of hybrid median filter in order to preserve the main image features.

### **60+ MATLAB Projects For Engineering Students**

In computer science, digital image processing is the use of a digital computer to process digital images through an algorithm. As a subcategory or field of digital signal processing, digital image processing has many advantages over analog image processing. It allows a much wider range of algorithms to be applied to the input data and can avoid problems such as the build-up of noise and ...
