includes problems of 2D and 3D Euclidean geometry plus trigonometry, compiled and solved from the Romanian Textbooks for 9th and 10th grade students, in the period 1981-1988, when I was a professor of mathematics at the "Petrache Poenaru" National

Compiled and Solved Problems in Geometry and Trigonometry

Since light moves in straight lines, changing directions when it interacts with materials, it is described by geometry and simple trigonometry. This part of optics, where the ray aspect of light dominates, is therefore calledgeometric optics. There are two laws that govern how light changes direction 888 CHAPTER 25 | GEOMETRIC OPTICS

Thus, the chord is 1 foot long, and we have just shown the usefulness (in this case) of trigonometry to geometric analysis. The following practice problem will allow you to apply what we have learned about circles and trigonometry to a similar situation. Practice Problem: Find the area of the shaded region, where r is 3 inches and α is 75°.

metrical optics as long as you accept the two rules which are easily verified by experiment. In most introductory texts, geometrical optics appears after Maxwell's equations and theory of light. There is a certain logic to this, first introducing a basic theory for light and then treating geometrical optics as a practical application of the ...

The geometrical optics gives us the rules for light propagating through optical devices. The geometrical optics could be made used to explain the geometrical imaging and aberrations. The lens is one of such optical device with axial symmetry which allows and refracts light ray to either converge or diverge the light beam.
